

Visionary Design System

Unified design language for all Visionary products — Lucky Charm, Dream Fund, and future products.

Principles

- Clarity Before Decoration
- Emotion Through Simplicity
- Consistency Over Customization
- Accessibility By Default
- Content First

How it works

Foundations define the visual language. Components apply those foundations through token slots. Themes adapt personality per product.

Foundations → Semantic tokens → Components → Themes → Product UI

- Use semantic and component tokens in product UI — not raw primitives.
- Themes remap allowed slots without forking foundations.
- Accessibility requirements apply to every surface.

Token architecture

- **Primitive** — raw palette values (green.500, spacing.4). Not used directly in product UI.
- **Semantic** — purpose-driven roles (background.default, action.primary). Shared across all products.
- **Component** — slot assignments for Button, Input, Card, Alert, Modal.
- **Theme** — product personality overrides (Lucky Charm, Dream Fund).

Products

Lucky Charm

Green primary, lavender accent, iridescence highlights.

Dream Fund

Green primary with warm warning-toned accent for dream-first financial screens.

Foundations

- Colors — primitive palettes, semantic roles, functional status, and product themes
- Typography — display, reading, and interface font roles with a defined scale
- Spacing — 4px-based scale from 4 to 96
- Radius — sm, md, lg, xl, and pill
- Elevation — card, dropdown, modal shadows and overlay scrim
- Icons — size scale and usage guidance
- Layout — breakpoints, grid, containers, and reading widths
- Accessibility — WCAG AA contrast, focus ring, touch targets, reduced motion

Components

Button

Input & Textarea

Card

Alert & Toast

Modal

Select, Checkbox, Radio, Switch

Tabs, Accordion, Menu, Breadcrumb

Badge, Chip, Avatar

Table, Pagination, Empty State

Specification

Source of truth: docs/design.md. All design values map to design-system/visionary tokens or --v-* CSS variables.
